

PANEL 8: Capturing Savings through Behavior

This panel explores human behavior and its interaction with all aspects of building-related energy use, including electric vehicle charging. The panel's intent is to inform program design, technological innovation, policy, and future behavioral research. In line with this year's Summer Study theme, we are particularly interested in papers that consider the intersection of human behavior and cultural and sociopsychological factors with energy efficiency, equity, and decarbonization. We invite papers based on behavioral and social sciences, technological innovation, empirical studies, and field experience that expand our collective understanding of human behavior.
